$$f(x) = \lambda e^{-\lambda x} \quad (1)$$

$$\text{Mean} = 1/\lambda \quad (2)$$

$$\text{Variance} = 1/\lambda^2 \quad (3)$$

Figure 1: My demonstration of the Central Limit Theorem.

It's known that when taking sufficiently sized samples of some data, despite it following a different distribution, converges to a Gaussian distribution with a smaller range. This is because when combining many discrete datapoints with large enough values of n , the natural "average" is Gaussian.

0.1 Reflection

1. 1st year, CS
2. Around 1 hr
3. I had some stats background from high school but I'm not very familiar with the content. LaTeX was completely new to me but it wasn't very challenging since I do programming/web dev with html/css etc.
